digits rather than smooth quantities, and the digits were decimal (0–9), represented by positions on toothed wheels, rather than the binary digits (“bits”) that the German mathematician-philosopher Gottfried Wilhelm von Leibniz had favoured (but did not use) in his Step Reckoner. Difference Engine | calculating machine | Britannica The difference engine consists of a number of columns, numbered from 1 to N. The machine is able to store one decimal number in each column. The machine can only add the value of a column  $n + 1$  to column  $n$  to produce the new value of  $n$ . Column  $N$  can only store a constant, column 1 displays (and possibly prints) the value of the calculation on the current iteration. Difference engine -
